VOLUNTARY ANNOUNCEMENT

Chinasoft First Launches Hongyun Virtual Machine, Ushering in New Breakthroughs in Dual-System Intelligent Interaction, Cross-Endpoint Flow and Massive Applications for HarmonyOS Computers

Chinasoft International Limited (hereinafter referred to as "**Chinasoft**" or "**the Company**") releases this announcement as a voluntary announcement to let the public know the latest information of the Company.

The Company is pleased to announce that recently, it has launched its self-developed Harmony-version virtual machine – Hongyun Virtual Machine, which has been listed on the Harmony PCs Application Market. Hongyun Virtual Machine enables Harmony PCs users to enjoy the intelligent interaction of HarmonyOS while seamlessly compatible with the mature software ecosystem of Windows, solving the application ecosystem bottleneck in the early stage of the new platform and bringing excellent experiences of dual-system intelligent interaction, cross-terminal flow and massive applications. In the field of TOB industry intelligent applications, it is deeply adapted to the HarmonyOS PCs and seamlessly compatible across platforms, providing unique value for the implementation and operation of localized solutions in key industries.

HONGYUN VIRTUAL MACHINE FEATURES THREE CORE ADVANTAGES:

First, "One Device, Dual Systems" Boundaryless Integration. Hongyun Virtual Machine deeply integrates the distributed technology with virtualization technology, constructing a secure and efficient Windows operating environment to achieve deep collaboration between the two systems.

Second, the built-in Hongyun App Store provides a rich repository of Windows applications tailored to meet the needs of long-tail Windows software and specific industry requirements. With a rigorous security review mechanism in place to ensure app quality, user privacy, and operational stability, users can download applications with complete confidence.

Third, the implementation of multiple layers of security safeguards ensures the protection of user data. In the event of abnormal virtual machine operation, system snapshots enable instant recovery, reconstructing the environment in seconds. Should the virtual machine unexpectedly shut down or files become corrupted, a professional data extraction mechanism retrieves critical information, safeguarding data assets to the greatest extent possible.

The Hongyun Virtual Machine provides critical support for promoting HarmonyOS PCs and prospering the HarmonyOS ecosystem. It drives innovation in HarmonyOS application paradigms and facilitates their large scale implementation, demonstrating the Company's technical strength in the R&D of domestic operating systems and the integration of application ecosystems.
